RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 30 pages. Original publisher: Ann Arbor, Mich. : U. S. Dept. of Commerce, National Oceanic and Atmospheric Administration, Environmental Research Laboratories, Great Lakes Environmental Research Laboratory, 1976 OCLC Number: (OCoLC)83369684 Subject: Long-range weather forecasting -- United States. Excerpt: . . . The boundaries of the three categories were taken as the mid-temperature value between the 8th and 9th and the 20th and 21st temperatures when all 28 were ranked lowest to highest. The exact procedure used to make the 1956 to 1975 conditional probability predictions as follows: (1) Determine the November and December temperature category preceding the forecast month based on the boundaries listed above. (2) Use tables 5 and 6 to determine the January and February temperature category and which have the highest probability of following the November and December categories which were determined in (1). For example, from table 5 one would always forecast a normal January if a below normal November occurred and from table 6 one would always forecast a normal February if a normal December occurred. (3) Determine the accuracy of the January and February 1956 to 1975 forecasts based on the actual temperatures which occurred during those months and using the category boundaries listed above. With the above procedure it was found that the 1956-75 Sault Ste. Marie January and February temperatures based on conditional probabilities from were accurate only 6 and 7 of 20 an independent period of time (1927-55) times, respectively (30 percent and 35 percent). The actual Sault Ste. Marie forecasts of January and Marie forecasts are shown in Appendix B. February temperatures based on 1927-55 data were made for Detroit and At Detroit...
